Batch-Normalization

February 9, 2022

1 ECE C147/247 HW4 Q2: Batch Normalization

In this notebook, you will implement the batch normalization layers of a neural network to increase its performance. Please review the details of batch normalization from the lecture notes.

utils has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, and their layer structure. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils.

```
[1]: ## Import and setups
     import time
     import numpy as np
     import matplotlib.pyplot as plt
     from nndl.fc_net import *
     from nndl.layers import *
     from utils.data_utils import get_CIFAR10_data
     from utils.gradient_check import eval_numerical_gradient,_
      ⇔eval_numerical_gradient_array
     from utils.solver import Solver
     %matplotlib inline
     plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
     plt.rcParams['image.interpolation'] = 'nearest'
     plt.rcParams['image.cmap'] = 'gray'
     # for auto-reloading external modules
     # see http://stackoverflow.com/questions/1907993/
      \rightarrow autoreload-of-modules-in-ipython
     %load ext autoreload
     %autoreload 2
     def rel_error(x, y):
       """ returns relative error """
       return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
[2]: # Load the (preprocessed) CIFAR10 data.

data = get_CIFAR10_data()
for k in data.keys():
    print('{}: {} '.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)
```

1.1 Batchnorm forward pass

Implement the training time batchnorm forward pass, batchnorm_forward, in nndl/layers.py. After that, test your implementation by running the following cell.

```
[3]: # Check the training-time forward pass by checking means and variances
     # of features both before and after batch normalization
     # Simulate the forward pass for a two-layer network
     N, D1, D2, D3 = 200, 50, 60, 3
     X = np.random.randn(N, D1)
     W1 = np.random.randn(D1, D2)
     W2 = np.random.randn(D2, D3)
     a = np.maximum(0, X.dot(W1)).dot(W2)
     print('Before batch normalization:')
     print(' means: ', a.mean(axis=0))
     print(' stds: ', a.std(axis=0))
     # Means should be close to zero and stds close to one
     print('After batch normalization (gamma=1, beta=0)')
     a norm, = batchnorm forward(a, np.ones(D3), np.zeros(D3), {'mode': 'train'})
     print(' mean: ', a_norm.mean(axis=0))
     print(' std: ', a_norm.std(axis=0))
     # Now means should be close to beta and stds close to gamma
     gamma = np.asarray([1.0, 2.0, 3.0])
     beta = np.asarray([11.0, 12.0, 13.0])
     a_norm, _ = batchnorm_forward(a, gamma, beta, {'mode': 'train'})
     print('After batch normalization (nontrivial gamma, beta)')
     print(' means: ', a_norm.mean(axis=0))
     print(' stds: ', a_norm.std(axis=0))
```

Before batch normalization:

means: [18.08245532 14.30449559 33.41358387] stds: [29.32085642 38.28340501 30.98650269]

```
After batch normalization (gamma=1, beta=0)
mean: [ 1.30173650e-16 -1.88182803e-16 -4.57134330e-16]
std: [0.99999999 1. 0.99999999]
After batch normalization (nontrivial gamma, beta)
means: [11. 12. 13.]
stds: [0.99999999 1.99999999 2.99999998]
```

Implement the testing time batchnorm forward pass, batchnorm_forward, in nndl/layers.py. After that, test your implementation by running the following cell.

```
[4]: # Check the test-time forward pass by running the training-time
     # forward pass many times to warm up the running averages, and then
     # checking the means and variances of activations after a test-time
     # forward pass.
     N, D1, D2, D3 = 200, 50, 60, 3
     W1 = np.random.randn(D1, D2)
     W2 = np.random.randn(D2, D3)
     bn_param = {'mode': 'train'}
     gamma = np.ones(D3)
     beta = np.zeros(D3)
     for t in np.arange(50):
       X = np.random.randn(N, D1)
      a = np.maximum(0, X.dot(W1)).dot(W2)
      batchnorm_forward(a, gamma, beta, bn_param)
     bn param['mode'] = 'test'
     X = np.random.randn(N, D1)
     a = np.maximum(0, X.dot(W1)).dot(W2)
     a_norm, _ = batchnorm_forward(a, gamma, beta, bn_param)
     # Means should be close to zero and stds close to one, but will be
     # noisier than training-time forward passes.
     print('After batch normalization (test-time):')
     print(' means: ', a_norm.mean(axis=0))
     print(' stds: ', a_norm.std(axis=0))
```

After batch normalization (test-time): means: [0.03389563 0.04485845 0.10096212]

stds: [1.1150012 0.93355312 0.94601145]

1.2 Batchnorm backward pass

Implement the backward pass for the batchnorm layer, batchnorm_backward in nndl/layers.py. Check your implementation by running the following cell.

```
[5]: # Gradient check batchnorm backward pass

N, D = 4, 5
```

```
x = 5 * np.random.randn(N, D) + 12
gamma = np.random.randn(D)
beta = np.random.randn(D)
dout = np.random.randn(N, D)
bn_param = {'mode': 'train'}
fx = lambda x: batchnorm_forward(x, gamma, beta, bn_param)[0]
fg = lambda a: batchnorm_forward(x, gamma, beta, bn_param)[0]
fb = lambda b: batchnorm_forward(x, gamma, beta, bn_param)[0]
dx_num = eval_numerical_gradient_array(fx, x, dout)
da_num = eval_numerical_gradient_array(fg, gamma, dout)
db_num = eval_numerical_gradient_array(fb, beta, dout)
_, cache = batchnorm_forward(x, gamma, beta, bn_param)
dx, dgamma, dbeta = batchnorm_backward(dout, cache)
print('dx error: ', rel_error(dx_num, dx))
print('dgamma error: ', rel_error(da_num, dgamma))
print('dbeta error: ', rel_error(db_num, dbeta))
```

dx error: 4.102799594114112e-10 dgamma error: 4.8208809343424334e-11 dbeta error: 3.276959277354581e-12

1.3 Implement a fully connected neural network with batchnorm layers

Modify the FullyConnectedNet() class in nndl/fc_net.py to incorporate batchnorm layers. You will need to modify the class in the following areas:

- (1) The gammas and betas need to be initialized to 1's and 0's respectively in __init__.
- (2) The batchnorm_forward layer needs to be inserted between each affine and relu layer (except in the output layer) in a forward pass computation in loss. You may find it helpful to write an affine_batchnorm_relu() layer in nndl/layer_utils.py although this is not necessary.
- (3) The batchnorm_backward layer has to be appropriately inserted when calculating gradients.

After you have done the appropriate modifications, check your implementation by running the following cell.

Note, while the relative error for W3 should be small, as we backprop gradients more, you may find the relative error increases. Our relative error for W1 is on the order of 1e-4.

```
[11]: N, D, H1, H2, C = 2, 15, 20, 30, 10
X = np.random.randn(N, D)
y = np.random.randint(C, size=(N,))

for reg in [0, 3.14]:
    print('Running check with reg = ', reg)
    model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
```

```
reg=reg, weight_scale=5e-2, dtype=np.float64,
                             use_batchnorm=True)
  loss, grads = model.loss(X, y)
  print('Initial loss: ', loss)
  for name in sorted(grads):
    f = lambda _: model.loss(X, y)[0]
    grad_num = eval_numerical_gradient(f, model.params[name], verbose=False,_
  \rightarrowh=1e-5)
    print('{} relative error: {}'.format(name, rel_error(grad_num,_
  ⇒grads[name])))
  if reg == 0: print('\n')
Running check with reg = 0
Initial loss: 2.2244131561672003
W1 relative error: 1.910603882187157e-05
W2 relative error: 1.5530850127155482e-05
W3 relative error: 4.0381176170850605e-10
b1 relative error: 0.0022204460492503126

gamma2 relative error: 4.6196135505950856e-09
```

1.4 Training a deep fully connected network with batch normalization.

To see if batchnorm helps, let's train a deep neural network with and without batch normalization.

```
[13]: # Try training a very deep net with batchnorm hidden_dims = [100, 100, 100, 100]
```

```
num_train = 1000
small data = {
  'X_train': data['X_train'][:num_train],
  'y_train': data['y_train'][:num_train],
  'X_val': data['X_val'],
  'y_val': data['y_val'],
}
weight scale = 2e-2
bn_model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_

use batchnorm=True)

model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_

use_batchnorm=False)

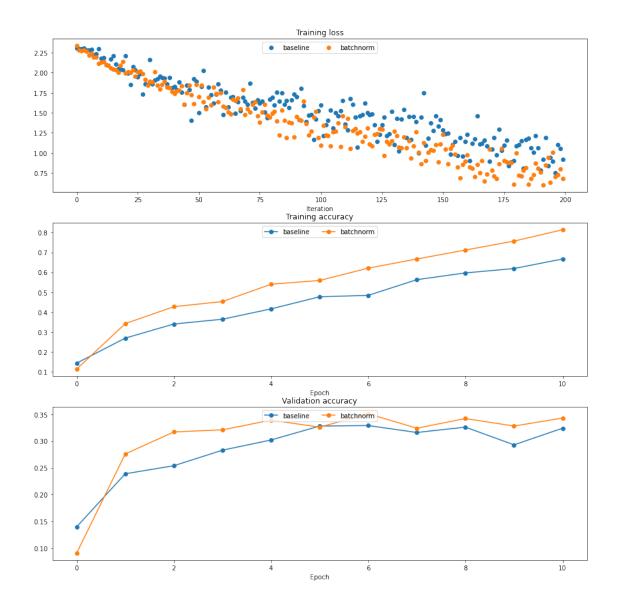

bn_solver = Solver(bn_model, small_data,
                num_epochs=10, batch_size=50,
                update_rule='adam',
                optim_config={
                  'learning_rate': 1e-3,
                },
                verbose=True, print_every=200)
bn_solver.train()
solver = Solver(model, small_data,
                num_epochs=10, batch_size=50,
                update_rule='adam',
                optim config={
                   'learning_rate': 1e-3,
                verbose=True, print_every=200)
solver.train()
(Iteration 1 / 200) loss: 2.336318
(Epoch 0 / 10) train acc: 0.113000; val_acc: 0.091000

1.5 Batchnorm and initialization

The following cells run an experiment where for a deep network, the initialization is varied. We do training for when batchnorm layers are and are not included.

```
[15]: # Try training a very deep net with batchnorm
hidden_dims = [50, 50, 50, 50, 50, 50]

num_train = 1000
small_data = {
    'X_train': data['X_train'][:num_train],
    'y_train': data['y_train'][:num_train],
    'X_val': data['X_val'],
```

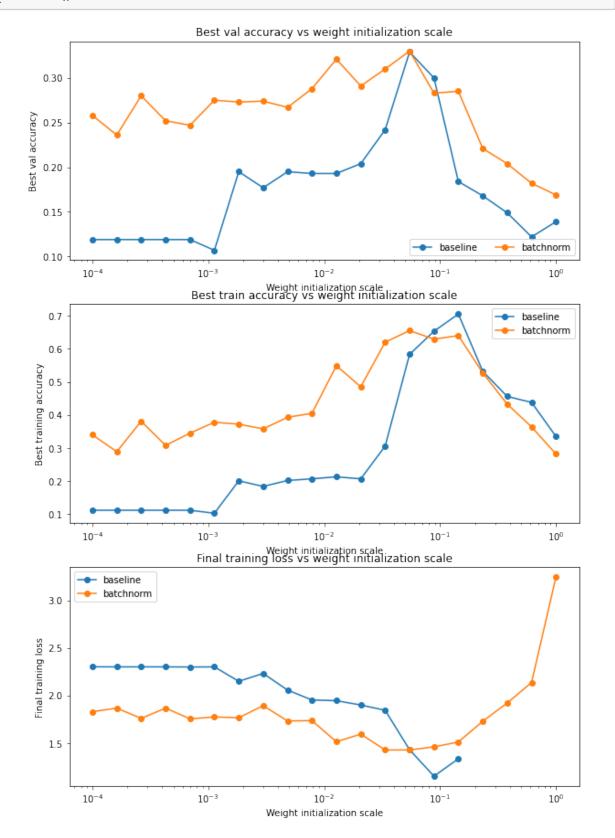

```
'y_val': data['y_val'],
bn_solvers = {}
solvers = {}
weight_scales = np.logspace(-4, 0, num=20)
for i, weight_scale in enumerate(weight_scales):
  print('Running weight scale {} / {}'.format(i + 1, len(weight_scales)))
  bn_model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_

use_batchnorm=True)

  model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_
  ⇔use_batchnorm=False)
  bn_solver = Solver(bn_model, small_data,
                  num_epochs=10, batch_size=50,
                   update_rule='adam',
                   optim_config={
                     'learning_rate': 1e-3,
                   },
                   verbose=False, print_every=200)
  bn solver.train()
  bn_solvers[weight_scale] = bn_solver
  solver = Solver(model, small_data,
                   num_epochs=10, batch_size=50,
                   update_rule='adam',
                   optim config={
                     'learning_rate': 1e-3,
                   },
                   verbose=False, print_every=200)
  solver.train()

```

1.6 Question:

In the cell below, summarize the findings of this experiment, and WHY these results make sense.

1.7 Answer:

Across weight initializations, batchnorm generally performs better and is more stable to changes in the initialization.

When our weight initalizations were low ($< 10^{-1}$), the baseline network likely has a **vanishing** gradient problem with weights going to zero. When the weights are intialized larger, we still get decent training accuracy, but poorer generalization to val accuracy probably due to exploding gradients/weights. Thus, the baseline is only comparable - and slightly better - than batchnorm in a narrow window of weight initilizations around 10^{-1} . Overall batchnorm is a far more robust technique.

[]:
